

UIPATH AGENTHACK · TEST CLOUD TRACK

# SelfHeal QA

The testing agent that knows when **not** to heal.

Built with Claude Code on UiPath for Coding Agents · [github.com/yanzaaa/selfheal](https://github.com/yanzaaa/selfheal)

SelfHeal QA

Autonomous testing you can trust

## THE PROBLEM

# Self-healing tests have a dangerous blind spot.

- › Brittle UI tests are the #1 reason teams give up on test automation.
- › Self-healing fixes brittleness, but blind healing can heal **right past a real bug**, turn green, and ship the regression.
- › Teams don't need tests that fix themselves. They need tests with **judgment**.

## THE IDEA

# An autonomous UiPath agent that makes two calls on its own.

### 1 · Risk-based selection

Looks at the code change and runs only the test suites that change can actually affect: just 1 of 4, not all of them.

### 2 · Triage on failure

When a step fails, decides: flaky locator → **heal it**, or real bug → **file it**. Heal where it's safe; raise the alarm where it counts.

SEE IT

# Same failure. Two very different responses.

## Brittle locator

Button id changed. The agent reads the live page, rewrites the selector, re-runs → **green**. No human needed.

## Real bug

Login is genuinely broken. The agent **refuses to heal** and files a defect in UiPath Test Manager, instead of masking it.

## THE TRUST QUESTION

# "How do I know it won't heal past a real bug?"

# 0%

false-negative rate: zero real bugs  
healed away, even on adversarial look-  
alikes (n=16, live Claude)

# 100%

triage accuracy across 16 labeled  
cases built to fool it

Every heal carries a confidence score; low-confidence heals are flagged for a human, not applied silently.

## HOW IT'S BUILT

# The orchestration runs on the UiPath platform.

WHY IT'S DIFFERENT

# Autopilot heals. SelfHeal QA heals **and knows when to stop.**

UiPath Autopilot for Testers already self-heals, so we didn't try to out-heal it. We went after its blind spot: the over-healing that silently masks regressions. SelfHeal QA turns **restraint** into an auto-filed defect, attacking the #1 risk of autonomous QA.

# Routine maintenance disappears. Judgment stays human.

- › Locator maintenance is fully automated away.
- › Humans only review the **real bugs** the agent surfaces, never hunting for them.
- › Drops into existing UiPath Test Manager workflows.

SELFHEAL QA

# The most dangerous bug is the one your tests quietly fixed for you.

SelfHeal QA knows when to stop.
